Douglas Mota Dias

# Context & Objectives

## Context:

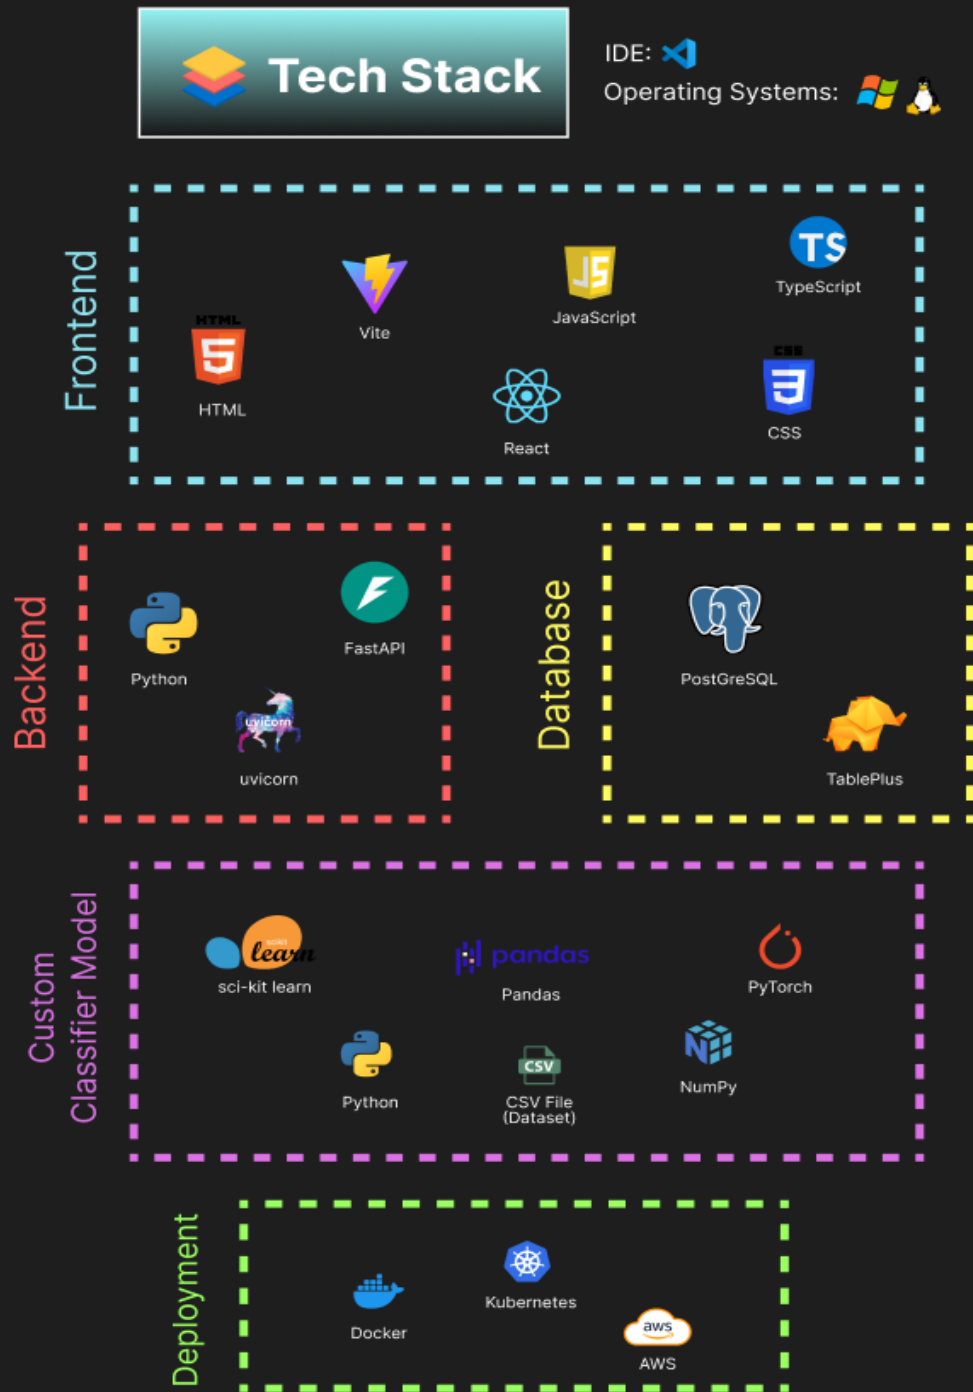

- Many beginners struggle with long programming tutorials and lectures.
- Platforms like LeetCode focus on advanced problems and can be difficult for beginners.

## Objectives:

- Create short beginner friendly programming challenges
- Use AI to adapt difficulty and give instant feedback
- Measure success through user progress and completed challenges

## Why this is interesting

- I have experienced these difficulties myself and seen them affect other students.

# Technologies & System Architecture

- Frontend uses React with TypeScript to build an interactive and reliable user interface. Vite for faster development experience.
- Backend uses Python with FastAPI because it is fast and easy to connect with AI features.
- PostgreSQL is used to store user data and learning progress safely. I had not used it. Supports clear relationships between data such as users lessons and results.
- Python is used for AI logic because it has strong support for machine learning tools.
- Docker is used to make deployment simple and consistent across systems.

# Development & Deployment

## Current Implemented Features:

- Registering users to PostGreSQL (Set up with TablePlus).
- Logging in validation.
- AI responses from Ollama local models and OpenAI API.
- Quiz Generation and correct / incorrect functionality.
